Spectral sequences

Spectral sequences

Definition. A *Spectral Sequence* $E = \{E^r, d^r\}$ is a family of \mathbb{Z} -bigraded modules E^1, E^2, \dots , each provided with a differential $d^r = \{d_{p,q}^r\}$ of bidegree $(-r, r-1)$ and with isomorphisms $H(E^r, d^r) \cong E^{r+1}$, $r = 1, 2, \dots$

Spectral sequences

Definition. A *Spectral Sequence* $E = \{E^r, d^r\}$ is a family of \mathbb{Z} -bigraded modules E^1, E^2, \dots , each provided with a differential $d^r = \{d_{p,q}^r\}$ of bidegree $(-r, r-1)$ and with isomorphisms $H(E^r, d^r) \cong E^{r+1}$, $r = 1, 2, \dots$

"If we think of a spectral sequence as a black box, then the input is a differential bigraded module, usually $E_{,*}^1$, and, with each turn of the handle, the machine computes a successive homology according to a sequence of differentials. If some differential is unknown, then some other (any other) principle is needed to proceed. [...] In the nontrivial cases, it is often a deep geometric idea that is caught up in the knowledge of a differential."*

John McCleary, User's guide to spectral sequences (Publish or Perish, 1985)

An example of spectral sequence

An example of spectral sequence

$$\text{A fibration } G \hookrightarrow E \rightarrow B$$

G is the fiber space, B the base space, and $E = B \times_{\tau} G$ the total space.

An example of spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

G is the fiber space, B the base space, and $E = B \times_{\tau} G$ the total space.

Theorem (Serre spectral sequence). *Let $G \hookrightarrow E \rightarrow B$ be a fibration with a base space B simply connected. Then a first quadrant spectral sequence $\{E_{p,q}^r, d_{p,q}^r\}_{r \geq 2}$ is defined with $E_{p,q}^2 = H_p(B, H_q(G))$ and $E_{p,q}^r \Rightarrow H_{p+q}(E)$.*

An example of spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

G is the fiber space, B the base space, and $E = B \times_{\tau} G$ the total space.

Theorem (Serre spectral sequence). *Let $G \hookrightarrow E \rightarrow B$ be a fibration with a base space B simply connected. Then a first quadrant spectral sequence $\{E_{p,q}^r, d_{p,q}^r\}_{r \geq 2}$ is defined with $E_{p,q}^2 = H_p(B, H_q(G))$ and $E_{p,q}^r \Rightarrow H_{p+q}(E)$.*

Using this spectral sequence, Serre computed many sphere homotopy groups.

An example of spectral sequence

An example of spectral sequence

- It is well known $\pi_n(S^3) = 0$ for $n < 3$ and $\pi_3(S^3) = \mathbb{Z}$.

An example of spectral sequence

- It is well known $\pi_n(S^3) = 0$ for $n < 3$ and $\pi_3(S^3) = \mathbb{Z}$.
- To compute $\pi_4(S^3)$, we consider a fibration $F_2 \hookrightarrow X_4 \rightarrow S^3$, where $F_2 = K(\mathbb{Z}, 2)$.

An example of spectral sequence

 \end{array}$$

The Hurewicz theorem and the long exact sequence of homotopy imply that $\pi_4(S^3) = \pi_4(X_4) = H_4(X_4) = \mathbb{Z}_2$.

An example of spectral sequence

An example of spectral sequence

- Then, a new fibration $F_3 \hookrightarrow X_5 \rightarrow X_4$ is considered to determine $\pi_5(S^3)$, where $F_3 = K(\mathbb{Z}_2, 3)$ is chosen because $\pi_4(X_4) = \mathbb{Z}_2$.

An example of spectral sequence

- Then, a new fibration $F_3 \hookrightarrow X_5 \rightarrow X_4$ is considered to determine $\pi_5(S^3)$, where $F_3 = K(\mathbb{Z}_2, 3)$ is chosen because $\pi_4(X_4) = \mathbb{Z}_2$.

Again some extra information is needed to compute the differentials, and we obtain $\pi_5(S^3) = \pi_5(X_4) = \pi_5(X_5) = H_5(X_5) = \mathbb{Z}_2$.

An example of spectral sequence

- Then, a new fibration $F_3 \hookrightarrow X_5 \rightarrow X_4$ is considered to determine $\pi_5(S^3)$, where $F_3 = K(\mathbb{Z}_2, 3)$ is chosen because $\pi_4(X_4) = \mathbb{Z}_2$.

Again some extra information is needed to compute the differentials, and we obtain $\pi_5(S^3) = \pi_5(X_4) = \pi_5(X_5) = H_5(X_5) = \mathbb{Z}_2$.

- Similarly, Serre used a new fibration $F_4 \hookrightarrow X_6 \rightarrow X_5$, with $F_4 = K(\mathbb{Z}_2, 4)$, to compute $\pi_6(S^3)$.

An example of spectral sequence

- Then, a new fibration $F_3 \hookrightarrow X_5 \rightarrow X_4$ is considered to determine $\pi_5(S^3)$, where $F_3 = K(\mathbb{Z}_2, 3)$ is chosen because $\pi_4(X_4) = \mathbb{Z}_2$.

Again some extra information is needed to compute the differentials, and we obtain $\pi_5(S^3) = \pi_5(X_4) = \pi_5(X_5) = H_5(X_5) = \mathbb{Z}_2$.

- Similarly, Serre used a new fibration $F_4 \hookrightarrow X_6 \rightarrow X_5$, with $F_4 = K(\mathbb{Z}_2, 4)$, to compute $\pi_6(S^3)$.

Using his spectral sequence, he proved $\pi_6(S^3)$ has 12 elements, but he was unable to choose between the two possible options \mathbb{Z}_{12} and $\mathbb{Z}_2 + \mathbb{Z}_6$.

Effective homology

Effective homology

Definition. A *reduction* ρ between two chain complexes A and B (denoted by $\rho : A \rightrightarrows B$) is a triple $\rho = (f, g, h)$

$$\begin{array}{ccc} & h & \\ & \curvearrowright & \\ & A & \begin{array}{c} \xrightarrow{f} \\ \xleftarrow{g} \end{array} B \end{array}$$

satisfying the following relations:

$$fg = \text{id}_B; \quad gf + d_A h + h d_A = \text{id}_A;$$

$$fh = 0; \quad hg = 0; \quad hh = 0.$$

Effective homology

Definition. A *reduction* ρ between two chain complexes A and B (denoted by $\rho : A \Rrightarrow B$) is a triple $\rho = (f, g, h)$

$$\begin{array}{ccc} & & f \\ & \curvearrowright & \\ h & A & \longrightarrow B \\ & \curvearrowleft & \\ & & g \end{array}$$

satisfying the following relations:

$$fg = \text{id}_B; \quad gf + d_A h + h d_A = \text{id}_A;$$

$$fh = 0; \quad hg = 0; \quad hh = 0.$$

Remark. If $A \Rrightarrow B$, then $A = B \oplus C$, with C acyclic, which implies that $H_*(A) \cong H_*(B)$.

Effective homology

Effective homology

Definition. A *(strong chain) equivalence* between the complexes A and B ($A \Leftarrow\!\!\Rightarrow\!\!\Rightarrow B$) is a triple (D, ρ, ρ') where D is a chain complex, $\rho : D \Rightarrow\!\!\Rightarrow A$ and $\rho' : D \Rightarrow\!\!\Rightarrow B$.

$$A \Leftarrow\!\!\Rightarrow\!\!\Rightarrow D \Rightarrow\!\!\Rightarrow B$$

Effective homology

Definition. A *(strong chain) equivalence* between the complexes A and B ($A \rightleftarrows B$) is a triple (D, ρ, ρ') where D is a chain complex, $\rho : D \rightrightarrows A$ and $\rho' : D \rightrightarrows B$.

$$A \rightleftarrows D \rightrightarrows B$$

Definition. An *object with effective homology* is a triple (X, EC, ε) where EC is an effective chain complex and $C(X) \rightleftarrows^{\varepsilon} EC$.

Effective homology

Definition. A *(strong chain) equivalence* between the complexes A and B ($A \rightleftarrows B$) is a triple (D, ρ, ρ') where D is a chain complex, $\rho : D \rightrightarrows A$ and $\rho' : D \rightrightarrows B$.

$$A \rightleftarrows D \rightrightarrows B$$

Definition. An *object with effective homology* is a triple (X, EC, ε) where EC is an effective chain complex and $C(X) \rightleftarrows^{\varepsilon} EC$.

Remark. This implies that $H_*(X) \cong H_*(EC)$.

The Kenzo system

The Kenzo system

Uses the notion of *object with effective homology* to compute homology groups of some complicated spaces.

The Kenzo system

Uses the notion of *object with effective homology* to compute homology groups of some complicated spaces.

If the complex is effective, then its homology groups can be determined by means of elementary operations with differential matrices. Otherwise, the program uses the effective homology.

The Kenzo system

Uses the notion of *object with effective homology* to compute homology groups of some complicated spaces.

If the complex is effective, then its homology groups can be determined by means of elementary operations with differential matrices. Otherwise, the program uses the effective homology.

Example: X_6 , total space of the fibration $F_4 \hookrightarrow X_6 \rightarrow X_5$

The Kenzo system

Uses the notion of *object with effective homology* to compute homology groups of some complicated spaces.

If the complex is effective, then its homology groups can be determined by means of elementary operations with differential matrices. Otherwise, the program uses the effective homology.

Example: X_6 , total space of the fibration $F_4 \hookrightarrow X_6 \rightarrow X_5$

$$H_6(X_6) = \mathbb{Z}_{12}$$

Computing spectral sequences

Computing spectral sequences

For the spectral sequence associated with a filtered chain complex, there exists a formal expression for the groups $E_{p,q}^r$ and the differential maps $d_{p,q}^r$, but they can only be determined in very simple situations.

Computing spectral sequences

For the spectral sequence associated with a filtered chain complex, there exists a formal expression for the groups $E_{p,q}^r$ and the differential maps $d_{p,q}^r$, but they can only be determined in very simple situations.

However, the effective homology method allows us to determine, as a by-product, this kind of spectral sequences, obtaining a real algorithm.

Computing spectral sequences

For the spectral sequence associated with a filtered chain complex, there exists a formal expression for the groups $E_{p,q}^r$ and the differential maps $d_{p,q}^r$, but they can only be determined in very simple situations.

However, the effective homology method allows us to determine, as a by-product, this kind of spectral sequences, obtaining a real algorithm.

This algorithm has been implemented as a set of programs (about 2500 lines) enhancing the Kenzo system, that determine the groups $E_{p,q}^r$ and also the differential maps $d_{p,q}^r$ for every level r .

Computing spectral sequences

Computing spectral sequences

These new methods work in a way that is similar to the mechanism of Kenzo for computing homology groups

Computing spectral sequences

These new methods work in a way that is similar to the mechanism of Kenzo for computing homology groups

- If the filtered complex is effective, then the spectral sequence can be computed through elementary methods with integer matrices.

Computing spectral sequences

These new methods work in a way that is similar to the mechanism of Kenzo for computing homology groups

- If the filtered complex is effective, then the spectral sequence can be computed through elementary methods with integer matrices.
- Otherwise, the effective homology is needed to compute it by means of an analogous spectral sequence deduced of an appropriate filtration on the associated effective complex.

Serre spectral sequence

Serre spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

Serre spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

If B and G are objects with effective homology

Serre spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

If B and G are objects with effective homology

- Kenzo computes the homology groups of the total space, $H_i(E)$

Serre spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

If B and G are objects with effective homology

- Kenzo computes the homology groups of the total space, $H_i(E)$
- the new programs compute the Serre spectral sequence associated with the fibration

Serre spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

If B and G are objects with effective homology

- Kenzo computes the homology groups of the total space, $H_i(E)$
- the new programs compute the Serre spectral sequence associated with the fibration

Example: $F_4 \hookrightarrow X_6 \rightarrow X_5$

Serre spectral sequence

A fibration $G \hookrightarrow E \rightarrow B$

If B and G are objects with effective homology

- Kenzo computes the homology groups of the total space, $H_i(E)$
- the new programs compute the Serre spectral sequence associated with the fibration

Example: $F_4 \hookrightarrow X_6 \rightarrow X_5$

$F_3 \hookrightarrow X_5 \rightarrow X_4$
